Sales & Business Performance Analytics

Portfolio Project / Simulated Business Case

Role Perspective: Business Analyst / Data Analyst

Tools: SQL, Excel, Power Query, Power BI

Methodology: Agile / Scrum

1. Project Overview

The Sales & Business Performance Analytics project aims to provide management with a centralized analytical view of sales, profitability, regional performance, product performance and customer trends. The solution will replace fragmented manual reporting with a structured analytics workflow supported by SQL, Excel/Power Query and Power BI.

2. Business Problem

The organization currently relies on manually prepared sales reports. This creates challenges in consolidating data, validating figures, monitoring performance trends and identifying business issues quickly. Management requires a consistent and interactive view of key sales and profitability metrics.

3. Business Objectives

- Provide a centralized view of sales and profitability KPIs.
- Analyze monthly sales and profit trends.
- Compare regional and state-level performance.
- Identify top and underperforming products and categories.
- Analyze customer segments and revenue contribution.
- Improve data validation and reporting consistency.
- Support data-driven business decisions through actionable insights.

4. Project Scope

In Scope: Sales, cost and profit analysis; regional/state analysis; product/category analysis; customer segment analysis; SQL analysis and validation; Power BI dashboard; UAT and business validation.

Out of Scope: Real-time transactional integration; production deployment; external market data; enterprise data warehouse implementation; mobile application development.

5. Stakeholders

Sales Manager: Sales trends, product and regional performance.

Finance Manager: Revenue, cost, profit and margin.

Regional Manager: Regional and state-level performance.

Business Leadership: Executive KPIs and trends.

Data/BI Team: Data preparation, modeling and dashboard development.

Business Users/QA: Validation and UAT.

6. Current Process

Sales data is collected from available source files and manually consolidated into reports. Analysts perform calculations and prepare summary views for management. Validation is performed manually, which can increase reporting effort

and delay decision-making.

7. Proposed Solution

Develop an end-to-end analytics workflow in which source data is cleaned and transformed using Excel/Power Query, analyzed and validated using SQL, modeled for reporting, and presented through an interactive Power BI dashboard. Business requirements, user stories and UAT artifacts will document the BA lifecycle.

8. Functional Requirements

FR-001: Display total sales, total profit, total orders, profit margin and average order value.

FR-002: Display monthly sales and profit trends.

FR-003: Allow analysis by region and state.

FR-004: Allow analysis by product and category.

FR-005: Allow analysis by customer segment and customer.

FR-006: Provide filters for date, region, state, category and customer segment.

FR-007: Provide product and regional ranking views.

FR-008: Ensure dashboard KPIs reconcile with validated source/SQL results.

9. Non-Functional Requirements

- Dashboard should be easy for business users to understand and navigate.
- KPI definitions should be consistent across reports.
- Data calculations should be traceable and validated.
- The solution should support filtering without compromising usability.
- Documentation should clearly describe assumptions and validation.

10. Assumptions

- The portfolio dataset is synthetic and created for demonstration purposes.
- The analysis uses the available sales, customer and product fields.
- Business rules and KPI definitions are agreed for this simulated case.
- The dashboard is a portfolio prototype rather than a production deployment.

11. Risks and Mitigations

Incorrect KPI calculations: Reconcile Power BI results with SQL and source data.

Data quality issues: Perform data profiling, cleaning and validation.

Changing requirements: Manage requirements through user stories and acceptance criteria.

Dashboard usability issues: Conduct UAT with representative business scenarios.

12. Success Criteria

- Business users can view agreed sales and profitability KPIs in one dashboard.
- Users can analyze performance by time, region, product and customer segment.
- Power BI KPIs reconcile with validated SQL results.
- UAT test cases are executed with documented outcomes.
- Key findings and business recommendations are documented.

13. Expected Deliverables

- Business Requirements Document
- User Stories and Acceptance Criteria
- Process Flow
- SQL Analysis Scripts

- Excel / Power Query Analysis
- Power BI Dashboard
- Data Validation Results
- UAT Test Cases and Defect Log
- Business Insights and Recommendations
